Having adequate ventilation in your home is important for good health. It removes moisture and stale air along with odours and pollutants and replaces them with fresh air to breathe.

Usually, ventilation is achieved by simply opening windows and doors (known as ‘natural’ or ‘passive’ ventilation) and by using extractor fans in steamy rooms such as kitchens and bathrooms. Although this works well, it can account for around one third of space heating energy demand in an average home as a lot of warm air flows outside. Draughts create a similar problem. While they serve to ventilate a home, they are a major source of heat loss and can make rooms feel uncomfortably chilly.

Modern energy efficient homes are more airtight (less draughty) than older buildings because they have to follow specifications for air-tightness in the Building Regulations. Because of this modern homes are sometimes fitted with Mechanical Ventilation with Heat Recovery (MVHR) systems also known as ‘whole house ventilation’ systems.

Modern energy efficient homes are more airtight (less draughty) than older buildings because they have to follow specifications for air-tightness in the Building Regulations. Because of this modern homes are sometimes fitted with Mechanical Ventilation with Heat Recovery (MVHR) systems also known as ‘whole house ventilation’ systems.

Modern homes have greatly reduced levels of ventilation which reduces heat loss and improves energy efficiency. A well designed mechanical ventilation system can provide the right amount of clean, fresh air that is vital for the health and wellbeing of a household.

How do they work?
Whole-house MVHR systems extract warm, damp air from the home and draw in fresh air from the outside. The warm, extracted air is passed through a heat exchanger to recover the heat before being expelled outside. The cool, fresh outside air is also passed through the heat exchanger, without coming into direct contact with the pollutant air where it is pre-warmed before being pumped in to the property.

Condensation occurs when moist air comes into contact with a colder surface like a window.
Above: a mechanical ventilation heat recovery system at work. Stale moist air is expelled from the home, but not before its warmth is ‘captured’ in the heat exchanger and passed on to the fresh air being drawn in.

These systems tend to comprise of concealed ducting in ceiling voids leading to the heat exchanger unit in the loft or another void in the home. Some units have an automatic or manual boost setting which can be used when generating excessive moisture whilst cooking or using the bathroom. Air filtration is commonly built into MVHR systems to prevent pollen and other particles from entering the home which then provides a more comfortable environment for allergy sufferers. Systems typically run continually at 80% efficiency and are inaudible during normal use.

Cost and savings
MVHR systems do require servicing as all equipment such as filters and fans must be kept clean to ensure effective operation. MVHR systems can cost in the region of £1,500 to £3000 but an accurate quote can only be provided based on your individual property, and retrofitting can be more expensive than a new-build.

Because the fresh air is pre-warmed, heat loss from ventilation is largely avoided. This means the householder can spend less on heating their property, reducing costs by around 25%, therefore saving money and ensuring a healthy, well ventilated home.

Here are a few ways to cut your bills …

Keep the oven door shut as much as possible; every time you open it, nearly a quarter of the heat escapes.

Give your clothes a day in the sun; and give your tumble drier a break. Clothes dried in the fresh air feel great.

Be a friend to your freezer. Defrost it regularly to help it run more efficiently.

Buying a new appliance? Check the energy label and buy A-rated goods.

Wait until you have a full load before putting on a wash. Two half-loads use more energy (and water) than one full load.

Sleep tight. Make sure all the lights are turned off when you go to bed, or use a low-wattage night light if you do need to leave one on.

Turn your heating down by 1 degree. You’ll hardly notice the change in temperature, but it’ll make a big difference to your heating bill.

Cup of tea? Only fill the kettle with as much as you’ll actually use (but make sure you cover the metal element).

The Centre for Sustainable Energy is a national charity that helps people change the way they think and act on energy.

Our Home Energy Team offers free advice on domestic energy use to householders in Bristol, Somerset, Wiltshire, South Gloucestershire and Dorset.
