Solid wall insulation may be suitable for a variety of property types such as brick, stone, steel-framed and concrete construction.

Internal solid wall insulation works by adding a thermal layer of material to the existing wall. Solid walls can be insulated internally (from the inside) and externally (from the outside). Both are significant undertakings in terms of cost and disruption but both options can make your home warmer and greatly reduce your heating bills at the same time.

Nearly half of all the heat lost from some solid-walled houses escapes through the walls. Insulating these walls will slow down the rate of heat loss and keep the warmth inside the home for longer.

Solid wall insulation is particularly appropriate where you need to keep the outside of your home looking the same.

**How do I know if my home has solid walls?**
If your home is made of brick, and the bricks have an alternating long-short-long pattern, then the walls are likely to be solid. If you can see only the long edge of the bricks, then the wall is almost certainly a cavity construction.

Cut-away model of internal solid wall insulation.

1 | Surface coating
This is the new plasterwork that covers the insulation layer. Just like a normal internal wall, it can be painted (green in this case) or papered.

2 | Insulation
This is the layer that prevents warmth escaping through the outside walls of the house. In this case, rigid insulation boards have been used.

3 | Internal wall
This is the old internal plaster which is now covered by the new insulation board and plasterwork.

4 | Windows
Ideally, the insulation board is fitted to the inside of the window recess to prevent cold patches developing where condensation forms. But, as is the case here, this is not always possible.

5 | External wall
From the outside your property will look exactly the same.

Average cost and savings
Internally insulating your home will probably cost between £5,500 and £8,500, depending on how many rooms are being renovated and the type of material being used. Generally this is less expensive than external solid wall insulation because of the lower cost of materials and labour.

A typical 3-bedroom semi-detached house using gas heating could save around £260 per year on heating bills by installing internal wall insulation whereas a detached house heating with oil could save around £450 per year.

Disruption
Internal solid wall insulation is a significant undertaking that inevitably involves a degree of disruption. Your installer should make you aware of any particular issues but things to consider include:

- A skip may be required;
- Rooms where the work is being done may not be usable whilst the work is being carried out and furniture, kitchen units etc may need to be temporarily removed;
- Fittings such as radiators, skirting boards, window sills and plug sockets that are on the wall that is being insulated will need to be removed and reattached afterwards;
- Pipe work and wiring may need to be re-laid;
- The works will produce dust and could well be noisy;
- Contractors will require water and power and the use of a toilet;
- The newly insulated walls and adjacent surfaces will need to be re-decorated when the work has finished.

Types of internal solid wall insulation
There are various ways to insulate a solid walled building from within, but they broadly fall into three categories:

1) Rigid insulation boards
These come in a variety of materials and thicknesses and deliver the highest energy saving. Some have pre-attached plasterboard which makes the installation process more straightforward.

2) Dry lining
Battens are fixed to the walls, insulation is fitted between them and then covered with plasterboard. This is a good option if the wall has a lot of heavy fittings such as book cases or kitchen cupboards, or if the original wall is rough and uneven, as in some stone properties.

3) Flexible thermal lining
This comes in rolls like thick wallpaper and is glued to the wall using a special adhesive. Flexible linings may not provide the same level of insulation but you could install the material yourself if you are a competent DIYer. Moreover, as flexible linings tend to be no more than 10mm thick they can be a good option for rooms that have limited space.
